

# AJAX

AJAX is an Information Age Armoured Fighting Vehicle (AFV) for the British Army, providing best-in-class protection, survivability, reliability, mobility and Intelligence, Surveillance, Target Acquisition and Reconnaissance (ISTAR) capabilities. Its range of variants will allow the British Army to conduct sustained, expeditionary, full-spectrum and network-enabled operations with a reduced logistics footprint. AJAX can operate in combined-arms and multinational situations across a wide range of future operating environments.

## Role and Capability:

- Best-in-class survivability, reliability and mobility – delivering a capability “step change” for the British Army
- 24-hour sensor capability that allows AJAX to find and engage targets more effectively at far greater ranges than legacy platforms
- Best-in-class lethality: CT 40mm cannon
- First fully digital AFV:
  - Integrates all on-board systems through a single, intuitive user interface
  - Can be fully operated under armor
  - Quicker and more economical to upgrade and keep capability relevant through-life
- Paradigm shift in AFV training: safer and more economical, with the majority done in simulation, including embedded, full-motion driver training and desktop aides
- Enabled with the latest communication systems
